

1

Sociology as an Individual Pastime

FROM *Invitation to Sociology*

PETER L. BERGER

What does it mean to "think sociologically"? In this selection from his book Invitation to Sociology, Peter Berger explains why sociologists are so annoying to the powers that be, the purveyors of conventional wisdom, advertisers, politicians, and others with a vested interest in your going along with their view of things. Sociologists have a reputation for stirring up the waters and occasionally making trouble. For Berger, this is just part of the way sociologists see the world.

It is gratifying from certain value positions (including some of this writer's) that sociological insights have served in a number of instances to improve the lot of groups of human beings by uncovering morally shocking conditions or by clearing away collective illusions or by showing that socially desired results could be obtained in more humane fashion. One might point, for example, to some applications of sociological knowledge in the penological practice of Western countries. Or one might cite the use made of sociological studies in the Supreme Court decision of 1954 on racial segregation in the public schools. Or one could look at the applications of other sociological studies to the humane planning of urban redevelopment. Certainly the sociologist who is morally and politically sensitive will derive gratification from such instances. But, once more, it will be well to keep in mind that what is at issue here is not sociological understanding as such but certain applications of this understanding. It is not difficult to see how the same understanding could be applied with opposite intentions. Thus the sociological understanding of the dynamics of racial prejudice can be applied effectively by those promoting intragroup hatred as well as by those wanting to spread tolerance. And the sociological understanding of the nature of human solidarity can be employed in the service of both totalitarian and democratic regimes.

* * *

One [more recent] image [of the sociologist is that of] a gatherer of statistics about human behavior. The sociologist is here seen essentially as an aide-de-camp to an IBM machine. He* goes out with a questionnaire, interviews

* Berger wrote this in 1963, using gendered language (preferring *he* to the now-standard *he/she*). Today more than half of all sociology students are women (ed.).

people selected at random, then goes home, enters his tabulations onto innumerable punch cards, which are then fed into a machine. In all of this, of course, he is supported by a large staff and a very large budget. Included in this image is the implication that the results of all this effort are picayune, a pedantic re-statement of what everybody knows anyway. As one observer remarked pithily, a sociologist is a fellow who spends \$100,000 to find his way to a house of ill repute.

This image of the sociologist has been strengthened in the public mind by the activities of many agencies that might well be called parasociological, mainly agencies concerned with public opinion and market trends. The pollster has become a well-known figure in American life, importuning people about their views from foreign policy to toilet paper. Since the methods used in the pollster business bear close resemblance to sociological research, the growth of this image of the sociologist is understandable. The Kinsey studies of American sexual behavior have probably greatly augmented the impact of this image. The fundamental sociological question, whether concerned with premarital petting or with Republican votes or with the incidence of gang knifings, is always presumed to be "how often?" or "how many?"

Now it must be admitted, albeit regretfully, that this image of the sociologist and his trade is not altogether a product of fantasy. Beginning shortly after World War I, American sociology turned rather resolutely away from theory to an intensive preoccupation with narrowly circumscribed empirical studies. In connection with this turn, sociologists increasingly refined their research techniques. Among these, very naturally, statistical techniques figured prominently. Since about the mid 1940s there has been a revival of interest in sociological theory, and there are good indications that this tendency away from a narrow empiricism is continuing to gather momentum. It remains true, however, that a goodly part of the sociological enterprise in this country continues to consist of little studies of obscure fragments of social life, irrelevant to any broader theoretical concern. One glance at the table of contents of the major sociological journals or at the list of papers read at sociological conventions will confirm this statement.

Statistical data by themselves do not make sociology. They become sociology only when they are sociologically interpreted, put within a theoretical frame of reference that is sociological. Simple counting, or even correlating different items that one counts, is not sociology. There is almost no sociology in the Kinsey reports. This does not mean that the data in these studies are not true or that they cannot be relevant to sociological understanding. They are, taken by themselves, raw materials that can be used in sociological interpretation. The interpretation, however, must be broader than the data them-

selves. So the sociologist cannot arrest himself at the frequency tables of premarital petting or extramarital pederasty. These enumerations are meaningful to him only in terms of their much broader implications for an understanding of institutions and values in our society. To arrive at such understanding the sociologist will often have to apply statistical techniques, especially when he is dealing with the mass phenomena of modern social life. But sociology consists of statistics as little as philology consists of conjugating irregular verbs or chemistry of making nasty smells in test tubes.

Sociology has, from its beginnings, understood itself as a science. There has been much controversy about the precise meaning of this self-definition. * * * But the allegiance of sociologists to the scientific ethos has meant everywhere a willingness to be bound by certain scientific canons of procedure. If the sociologist remains faithful to his calling, his statements must be arrived at through the observation of certain rules of evidence that allow others to check on or to repeat or to develop his findings further. It is this scientific discipline that often supplies the motive for reading a sociological work as against, say, a novel on the same topic that might describe matters in much more impressive and convincing language. As sociologists tried to develop their scientific rules of evidence, they were compelled to reflect upon methodological problems. This is why methodology is a necessary and valid part of the sociological enterprise.

At the same time it is quite true that some sociologists, especially in America, have become so preoccupied with methodological questions that they have ceased to be interested in society at all. As a result, they have found out nothing of significance about any aspect of social life, since in science as in love a concentration on technique is quite likely to lead to impotence. Much of this fixation on methodology can be explained in terms of the urge of a relatively new discipline to find acceptance on the academic scene. Since science is an almost sacred entity among Americans in general and American academicians in particular, the desire to emulate the procedures of the older natural sciences is very strong among the newcomers in the marketplace of erudition.

As they become more secure in their academic status, it may be expected that this methodological inferiority complex will diminish even further.

The charge that many sociologists write in a barbaric dialect must also be admitted with similar reservations. Any scientific discipline must develop a terminology. This is self-evident for a discipline such as, say, nuclear physics that deals with matters unknown to most people and for which no words exist in common speech. However, terminology is possibly even more important for the social sciences, just because their subject matter is familiar and just because words *do* exist to denote it. Because we are well acquainted with the social institutions that surround us, our perception of them is imprecise and

often erroneous. In very much the same way most of us will have considerable difficulty giving an accurate description of our parents, husbands or wives, children or close friends. Also, our language is often (and perhaps blessedly) vague and confusing in its references to social reality. Take for an example the concept of *class*, a very important one in sociology. There must be dozens of meanings that this term may have in common speech—income brackets, races, ethnic groups, power cliques, intelligence ratings, and many others. It is obvious that the sociologist must have a precise, unambiguous definition of the concept if his work is to proceed with any degree of scientific rigor. In view of these facts, one can understand that some sociologists have been tempted to invent altogether new words to avoid the semantic traps of the vernacular usage.

Finally, we would look at an image of the sociologist not so much in his professional role as in his being, supposedly, a certain kind of person. This is the image of the sociologist as a detached, sardonic observer, and a cold manipulator of men. Where this image prevails, it may represent an ironic triumph of the sociologist's own efforts to be accepted as a genuine scientist. The sociologist here becomes the self-appointed superior man, standing off from the warm vitality of common existence, finding his satisfactions not in living but in coolly appraising the lives of others, filing them away in little categories, and thus presumably missing the real significance of what he is observing. Further, there is the notion that, when he involves himself in social processes at all, the sociologist does so as an uncommitted technician, putting his manipulative skills at the disposal of the powers that be.

This last image is probably not very widely held. * * * As a general portrait of the contemporary sociologist it is certainly a gross distortion. It fits very few individuals that anyone is likely to meet in this country today. The problem of the political role of the social scientist is, nevertheless, a very genuine one. For instance, the employment of sociologists by certain branches of industry and government raises moral questions that ought to be faced more widely than they have been so far. These are, however, moral questions that concern all men in positions of responsibility in modern society. The image of the sociologist as an observer without compassion and a manipulator without conscience need not detain us further here. * * * As for contemporary sociologists, most of them would lack the emotional equipment for such a role, even if they should aspire to it in moments of feverish fantasy.

How then are we to conceive of the sociologist? In discussing the various images of him that abound in the popular mind we have already brought out certain elements that would have to go into our conception.

* * *

The sociologist, then, is someone concerned with understanding society in a disciplined way. The nature of this discipline is scientific. This means that what the sociologist finds and says about the social phenomena he studies oc-

curs within a certain rather strictly defined frame of reference. One of the main characteristics of this scientific frame of reference is that operations are bound by certain rules of evidence. As a scientist, the sociologist tries to be objective, to control his personal preferences and prejudices, to perceive clearly rather than to judge normatively. This restraint, of course, does not embrace the totality of the sociologist's existence as a human being, but is limited to his operations *qua* sociologist. Nor does the sociologist claim that his frame of reference is the only one within which society can be looked at. For that matter, very few scientists in any field would claim today that one should look at the world only scientifically. The botanist looking at a daffodil has no reason to dispute the right of the poet to look at the same object in a very different manner. There are many ways of playing. The point is not that one denies other people's games but that one is clear about the rules of one's own. The game of the sociologist, then, uses scientific rules. As a result, the sociologist must be clear in his own mind as to the meaning of these rules. That is, he must concern himself with methodological questions. Methodology does not constitute his goal. The latter, let us recall once more, is the attempt to understand society. Methodology helps in reaching this goal. In order to understand society, or that segment of it that he is studying at the moment, the sociologist will use a variety of means. Among these are statistical techniques. Statistics can be very useful in answering certain sociological questions. But statistics does not constitute sociology. As a scientist, the sociologist will have to be concerned with the exact significance of the terms he is using. That is, he will have to be careful about terminology. This does not have to mean that he must invent a new language of his own, but it does mean that he cannot naively use the language of everyday discourse. Finally, the interest of the sociologist is primarily theoretical. That is, he is interested in understanding for its own sake. He may be aware of or even concerned with the practical applicability and consequences of his findings, but at that point he leaves the sociological frame of reference as such and moves into realms of values, beliefs and ideas that he shares with other men who are not sociologists.

* * *

[THE MOTIVATION TO DO SOCIOLOGY]

[W]e would like to go a little bit further here and ask a somewhat more personal (and therefore, no doubt, more controversial) question. We would like to ask not only what it is that the sociologist is doing but also what it is that drives him to it. Or, to use the phrase Max Weber used in a similar connection, we want to inquire a little into the nature of the sociologist's demon. In doing so, we shall evoke an image that is not so much ideal-typical in the above sense but more confessional in the sense of personal commitment.

Again, we are not interested in excommunicating anyone. The game of sociology goes on in a spacious playground. We are just describing a little more closely those we would like to tempt to join our game.

We would say then that the sociologist (that is, the one we would really like to invite to our game) is a person intensively, endlessly, shamelessly interested in the doings of men. His natural habitat is all the human gathering places of the world, wherever men come together. The sociologist may be interested in many other things. But his consuming interest remains in the world of men, their institutions, their history, their passions. And since he is interested in men, nothing that men do can be altogether tedious for him. He will naturally be interested in the events that engage men's ultimate beliefs, their moments of tragedy and grandeur and ecstasy. But he will also be fascinated by the common place, the everyday. He will know reverence, but this reverence will not prevent him from wanting to see and to understand. He may sometimes feel revulsion or contempt. But this also will not deter him from wanting to have his questions answered. The sociologist, in his quest for understanding, moves through the world of men without respect for the usual lines of demarcation. Nobility and degradation, power and obscurity, intelligence and folly—these are equally *interesting* to him, however unequal they may be in his personal values or tastes. Thus his questions may lead him to all possible levels of society, the best and the least known places, the most respected and the most despised. And, if he is a good sociologist, he will find himself in all these places because his own questions have so taken possession of him that he has little choice but to seek for answers.

It would be possible to say the same things in a lower key. We could say that the sociologist, but for the grace of his academic title, is the man who must listen to gossip despite himself, who is tempted to look through keyholes, to read other people's mail, to open closed cabinets. Before some otherwise unoccupied psychologist sets out now to construct an aptitude test for sociologists on the basis of sublimated voyeurism, let us quickly say that we are speaking merely by way of analogy. Perhaps some little boys consumed with curiosity to watch their maiden aunts in the bathroom later become inveterate sociologists. This is quite uninteresting. What interests us is the curiosity that grips any sociologist in front of a closed door behind which there are human voices. If he is a good sociologist, he will want to open that door, to understand these voices. Behind each closed door he will anticipate some new facet of human life not yet perceived and understood.

The sociologist will occupy himself with matters that others regard as too sacred or as too distasteful for dispassionate investigation. He will find rewarding the company of priests or of prostitutes, depending not on his personal preferences but on the questions he happens to be asking at the moment. He will also concern himself with matters that others may find much too boring. He will be interested in the human interaction that goes with warfare or with great intellectual discoveries, but also in the relations

between people employed in a restaurant or between a group of little girls playing with their dolls. His main focus of attention is not the ultimate significance of what men do, but the action in itself, as another example of the infinite richness of human conduct. So much for the image of our playmate.

In these journeys through the world of men the sociologist will inevitably encounter other professional Peeping Toms. Sometimes these will resent his presence, feeling that he is poaching on their preserves. In some places the sociologist will meet up with the economist, in others with the political scientist, in yet others with the psychologist or the ethnologist. Yet chances are that the questions that have brought him to these same places are different from the ones that propelled his fellow-trespassers. The sociologist's questions always remain essentially the same: "What are people doing with each other here?" "What are their relationships to each other?" "How are these relationships organized in institutions?" "What are the collective ideas that move men and institutions?" In trying to answer these questions in specific instances, the sociologist will, of course, have to deal with economic or political matters, but he will do so in a way rather different from that of the economist or the political scientist. The scene that he contemplates is the same human scene that these other scientists concern themselves with. But the sociologist's angle of vision is different. When this is understood, it becomes clear that it makes little sense to try to stake out a special enclave within which the sociologist will carry on business in his own right. * * * There is, however, one traveler whose path the sociologist will cross more often than anyone else's on his journeys. This is the historian. Indeed, as soon as the sociologist turns from the present to the past, his preoccupations are very hard indeed to distinguish from those of the historian. However, we shall leave this relationship to a later part of our considerations. Suffice it to say here that the sociological journey will be much impoverished unless it is punctuated frequently by conversation with that other particular traveler.

Any intellectual activity derives excitement from the moment it becomes a trail of discovery. In some fields of learning this is the discovery of worlds previously unthought and unthinkable. This is the excitement of the astronomer or of the nuclear physicist on the antipodal boundaries of the realities that man is capable of conceiving. But it can also be the excitement of bacteriology or geology. In a different way it can be the excitement of the linguist discovering new realms of human expression or of the anthropologist exploring human customs in faraway countries. In such discovery, when undertaken with passion, a widening of awareness, sometimes a veritable transformation of consciousness, occurs. The universe turns out to be much more wonderful than one had ever dreamed. The excitement of sociology is usually of a different sort. Sometimes, it is true, the sociologist penetrates into worlds that had previously been quite unknown to him—for instance, the world of crime, or the world of some bizarre religious sect, or the world fashioned by the exclusive concerns of some group such as medical specialists or military leaders or

advertising executives. However, much of the time the sociologist moves in sectors of experience that are familiar to him and to most people in his society. He investigates communities, institutions and activities that one can read about every day in the newspapers. Yet there is another excitement of discovery beckoning in his investigations. It is not the excitement of coming upon the totally unfamiliar, but rather the excitement of finding the familiar becoming transformed in its meaning. The fascination of sociology lies in the fact that its perspective makes us see in a new light the very world in which we have lived all our lives. This also constitutes a transformation of consciousness. Moreover, this transformation is more relevant existentially than that of many other intellectual disciplines, because it is more difficult to segregate in some special compartment of the mind. The astronomer does not live in the remote galaxies, and the nuclear physicist can, outside his laboratory, eat and laugh and marry and vote without thinking about the insides of the atom. The geologist looks at rocks only at appropriate times, and the linguist speaks English with his wife. The sociologist lives in society, on the job and off it. His own life, inevitably, is part of his subject matter. Men being what they are, sociologists too manage to segregate their professional insights from their everyday affairs. But it is a rather difficult feat to perform in good faith.

The sociologist moves in the common world of men, close to what most of them would call real. The categories he employs in his analyses are only refinements of the categories by which other men live—power, class, status, race, ethnicity. As a result, there is a deceptive simplicity and obviousness about some sociological investigations. One reads them, nods at the familiar scene, remarks that one has heard all this before and don't people have better things to do than to waste their time on truisms—until one is suddenly brought up against an insight that radically questions everything one had previously assumed about this familiar scene. This is the point at which one begins to sense the excitement of sociology.

Let us take a specific example. Imagine a sociology class in a Southern college where almost all the students are white Southerners. Imagine a lecture on the subject of the racial system of the South. The lecturer is talking here of matters that have been familiar to his students from the time of their infancy. Indeed, it may be that they are much more familiar with the minutiae of this system than he is. They are quite bored as a result. It seems to them that he is only using more pretentious words to describe what they already know. Thus he may use the term "caste," one commonly used now by American sociologists to describe the Southern racial system. But in explaining the term he shifts to traditional Hindu society, to make it clearer. He then goes on to analyze the magical beliefs inherent in caste tabus, the social dynamics of commensalism and connubium, the economic interests concealed within the system, the way in which religious beliefs relate to the tabus, the effects of the caste system upon the industrial development of the society and vice versa—

all in India. But suddenly India is not very far away at all. The lecture then goes back to its Southern theme. The familiar now seems not quite so familiar any more. Questions are raised that are new, perhaps raised angrily, but raised all the same. And at least some of the students have begun to understand that there are functions involved in this business of race that they have not read about in the newspapers (at least not those in their hometowns) and that their parents have not told them—partly, at least, because neither the newspapers nor the parents knew about them.

It can be said that the first wisdom of sociology is this—things are not what they seem. This too is a deceptively simple statement. It ceases to be simple after a while. Social reality turns out to have many layers of meaning. The discovery of each new layer changes the perception of the whole.

Anthropologists use the term "culture shock" to describe the impact of a totally new culture upon a newcomer. In an extreme instance such shock will be experienced by the Western explorer who is told, halfway through dinner, that he is eating the nice old lady he had been chatting with the previous day—a shock with predictable physiological if not moral consequences. Most explorers no longer encounter cannibalism in their travels today. However, the first encounters with polygamy or with puberty rites or even with the way some nations drive their automobiles can be quite a shock to an American visitor. With the shock may go not only disapproval or disgust but a sense of excitement that things can *really* be that different from what they are at home. To some extent, at least, this is the excitement of any first travel abroad. The experience of sociological discovery could be described as "culture shock" minus geographical displacement. In other words, the sociologist travels at home—with shocking results. He is unlikely to find that he is eating a nice old lady for dinner. But the discovery, for instance, that his own church has considerable money invested in the missile industry or that a few blocks from his home there are people who engage in cultic orgies may not be drastically different in emotional impact. Yet we would not want to imply that sociological discoveries are always or even usually outrageous to moral sentiment. Not at all. What they have in common with exploration in distant lands, however, is the sudden illumination of new and unsuspected facets of human existence in society. This is the excitement and, as we shall try to show later, the humanistic justification of sociology.

People who like to avoid shocking discoveries, who prefer to believe that society is just what they were taught in Sunday School, who like the safety of the rules and the maxims of what Alfred Schuetz has called the "world-taken-for-granted," should stay away from sociology. People who feel no temptation before closed doors, who have no curiosity about human beings, who are content to admire scenery without wondering about the people who live in those houses on the other side of that river, should probably also stay away from sociology. They will find it unpleasant or, at any rate, unrewarding. People who are interested in human beings only if they can change, convert or reform

them should also be warned, for they will find sociology much less useful than they hoped. And people whose interest is mainly in their own conceptual constructions will do just as well to turn to the study of little white mice. Sociology will do just as well to turn to the study of little mice. Sociology will be satisfying, in the long run, only to those who can think of nothing more entrancing than to watch men and to understand things human.

* * *

To be sure, sociology is an individual pastime in the sense that it interests some men and bores others. Some like to observe human beings, others to experiment with mice. The world is big enough to hold all kinds and there is no logical priority for one interest as against another. But the word "pastime" is weak in describing what we mean. Sociology is more like a passion. The sociological perspective is more like a demon that possesses one, that drives one compellingly, again and again, to the questions that are its own. An introduction to sociology is, therefore, an invitation to a very special kind of passion.

2

FROM *The Sociological Imagination*

C. WRIGHT MILLS

C. Wright Mills wrote of his own work, "I have tried to be objective; I do not claim to be detached." He argues that sociologists' questions come from the same sources as the important questions everyone asks: their own experiences and the things that perplex, confuse, and inspire them. To be effective, sociology must make a connection between the individual and the social. It must allow the individual to see the larger social context in which his or her life is lived, and in this way give both understanding and meaning to personal experiences.

Nowadays men often feel that their private lives are a series of traps. They sense that within their everyday worlds, they cannot overcome their troubles, and in this feeling, they are often quite correct: What ordinary men are directly aware of and what they try to do are bounded by the private orbits in which they live; their visions and their powers are limited to the close-up scenes of job, family, neighborhood; in other milieux, they move vicariously and remain spectators. And the more aware they become, however vaguely, of ambitions and of threats which transcend their immediate locales, the more trapped they seem to feel.

Underlying this sense of being trapped are seemingly impersonal changes in the very structure of continent-wide societies. The facts of contemporary history are also facts about the success and the failure of individual men and women. When a society is industrialized, a peasant becomes a worker; a feudal lord is liquidated or becomes a businessman. When classes rise or fall, a man is employed or unemployed; when the rate of investment goes up or down, a man takes new heart or goes broke. When wars happen, an insurance salesman becomes a rocket launcher; a store clerk, a radar man; a wife lives alone; a child grows up without a father. Neither the life of an individual nor the history of a society can be understood without understanding both.

Yet men do not usually define the troubles they endure in terms of historical change and institutional contradiction. The well-being they enjoy, they do not usually impute to the big ups and downs of the societies in which they live. Seldom aware of the intricate connection between the patterns of their own lives and the course of world history, ordinary men do not usually know what this connection means for the kinds of men they are becoming and for the kinds of history-making in which they might take part. They do not pos-
