

Is porn immoral? That doesn't matter: It's a public health crisis.

The science is now beyond dispute.

Last month, the Republican-led Utah House of Representatives became the first legislative body in the United States to pass a resolution declaring pornography “a public health hazard leading to a broad spectrum of individual and public health impacts and societal harms.” The liberal backlash criticized the measure as an antiquated bit of conservative moralizing, with the Daily Beast calling it “hypocritical” and “short-sighted.” “The science just isn't there,” wrote Rewire, an online journal dedicated to dispelling “falsehoods and misinformation.”

The thing is, no matter what you think of pornography (whether it's harmful or harmless fantasy), the science is there. After 40 years of peer-reviewed research, scholars can say with confidence that porn is an industrial product that shapes how we think about gender, sexuality, relationships, intimacy, sexual violence and gender equality — for the worse. By taking a health-focused view of porn and recognizing its radiating impact not only on consumers but also on society at large, Utah's resolution simply reflects the latest research.

Utah lawmaker says porn is a public health hazard

The statistics on today's porn use are staggering. A [Huffington Post headline](#) announced in 2013 that "Porn Sites Get More Visitors Each Month Than Netflix, Amazon and Twitter Combined," and one of the largest free porn sites in the world, YouPorn, [streamed six times the bandwidth of Hulu in 2013](#). Pornhub, another major free porn site, [boasted that in 2015 it received 21.2 billion visits and "streamed 75GB of data a second, which translates to enough porn to fill the storage in around 175 million 16GB iPhones."](#)

Extensive scientific research reveals that exposure to and consumption of porn threaten the social, emotional and physical health of individuals, families and communities, and highlights the degree to which porn is a public health crisis rather than a private matter. But just as the tobacco industry argued for decades that there was no proof of a connection between smoking and lung cancer, so, too, has the porn industry, with the help of a [well-oiled public relations machine](#), denied the existence of empirical research on the impact of its products.

Using a wide range of methodologies, researchers from a number of disciplines have shown that viewing pornography is associated with damaging outcomes. In a [study of U.S. college men](#), researchers found that 83 percent reported seeing mainstream pornography, and that those who did were more likely to say they would commit rape or sexual assault (if they knew they wouldn't be caught) than men who hadn't seen porn in the past 12 months. The same study found that porn consumers were less likely to intervene if they observed a sexual assault taking place. In a [study of young teens](#) throughout the southeastern United States, 66 percent of boys reported porn consumption in the past year; this early porn exposure was correlated with perpetration of sexual harassment two years later. A [recent meta-analysis of 22 studies](#) between 1978 and 2014 from seven different countries concluded that pornography consumption is associated with an increased likelihood of committing acts of verbal or physical sexual aggression, regardless of age. A [2010 meta-analysis](#) of several studies found "an overall significant positive association between pornography use and attitudes supporting violence against women."

A 2012 study of college-aged women with male partners who used porn concluded that the young women suffered diminished self-esteem, relationship quality and sexual satisfaction correlated with their partners' porn use. Meanwhile, a 2004 study found that exposure to filmed sexual content profoundly hastens adolescents' initiation of sexual behavior: "The size of the adjusted intercourse effect was such that youths in the 90th percentile of TV sex viewing had a predicted probability of intercourse initiation [in the subsequent year] that was approximately double that of youths in the 10th percentile," the study's authors wrote. All of these studies were published in peer-reviewed journals.

Because so much porn is free and unfiltered on most digital devices, the average age of first viewing porn is estimated by some researchers to be 11. In the absence of a comprehensive sex-education curriculum in many schools, pornography has become de facto sex education for youth. And what are these children looking at? If you have in your mind's eye a Playboy centerfold with a naked woman smiling in a cornfield, then think again. While "classy" lad mags like Playboy are dispensing with the soft-core nudes of yesteryear, free and widely available pornography is often violent, degrading and extreme.

In a content analysis of best-selling and most-rented porn films, researchers found that 88 percent of analyzed scenes contained physical aggression: generally spanking, gagging, choking or slapping. Verbal aggression occurred in 49 percent of the scenes, most often in the form of calling a woman "bitch" and "slut." Men perpetrated 70 percent of the aggressive acts, while women were the targets 94 percent of the time. It is difficult to account for all of the "gonzo" and amateur porn available online, but there is reason to believe that the rented and purchased porn in the analysis largely reflects the content of free porn sites. As researcher Shira Tarrant points out, "The tube sites are aggregators of a bunch of different links and clips, and they are very often pirated or stolen." So porn that was produced for sale is proffered for free.

The performers who make up the porn industry are also at risk, in ways that affect them as well as members of the broader public. Aside from frequent claims of sexual violence and harassment, film sets are often flush with sexually transmitted infections. In a 2012 study that examined 168 sex industry performers (67 percent were female and 33 percent were male), 28 percent were suffering from one of 96 infections. Even more troubling, according to

the authors, was that the porn industry's protocols significantly underdiagnosed infections: 95 percent of mouth and throat infections, and 91 percent of rectal infections, were asymptomatic, which, the authors argue, made them more likely to be passed on to partners both in and out of the sex industry. Since members of the industry have protested proposed safety measures requiring the use of condoms and other prophylactics, legislating to protect these performers has proven challenging.

Beyond the porn industry, legislators have begun to respond to yet another genre of pornography quickly proliferating on the Web: "revenge porn," whose perpetrators post and disseminate sexually explicit photos of their victims (often their former girlfriends) online without their consent. Unsurprisingly, revenge porn has been linked to several suicides and has been used to blackmail and sexually exploit minors.

As the evidence piles up, a coalition of academics, health professionals, educators, feminist activists and caregivers has decided that they can no longer allow the porn industry to hijack the physical and emotional well-being of our culture. This means understanding that porn is everyone's problem. Culture Reframed, an organization I founded and currently chair, is pioneering a strategy to address porn as the public health crisis of the digital age. We are developing educational programs for parents, youth and a range of professionals that aim to help shift the culture from one that normalizes a pornographic, oppression-based sexuality to one that values and promotes a sexuality rooted in healthy intimacy, mutual care and respect.

Parents and educators at every level need to know that if porn is not discussed in a research-based, age-appropriate sexual health curriculum, its effects will surely show up as sexual harassment, dating violence and inadvertent "child pornography" on students' phones. Pornography can cause lifelong problems if young people are not taught to distinguish between exploitative porn sex and healthy, safe sex. As the research shows, porn is not merely a moral nuisance and subject for culture-war debates. It's a threat to our public health.
