| Op-Code | Operand | Description |
| :---: | :---: | :---: |
| 1 | RXY | LOAD the register $R$ with the bit pattern found in the memory cell whose address is XY |
| 2 | RXY | LOAD the register R with the bit XY |
| 3 | RXY | STORE the bit pattern found in register R in the memory cell whose address is XY |
| 4 | ORS | MOVE the bit pattern found in register R to register S |
| 5 | RST | ADD the bit patterns in registers $S$ and $T$ as though they were two's complement representations and leave the result in register R |
| 6 | RST | ADD the bit patterns in registers $S$ and $T$ as though they represented values in floating-point notation and leave the result in register R |
| 7 | RST | OR the bit pattern in registers $S$ and $T$ and place the result in register R |
| 8 | RST | AND the bit patterns in register $S$ and $T$ and place the result in register $R$ |
| 9 | RST | Exclusive OR the bit patterns in registers $S$ and $T$ and place the result in register $R$ |
| A | R0X | ROTATE the bit pattern in register R one bit to the right X times. Each time place the bit that started at the low-order end at the high-order end. |
| B | RXY | JUMP to the instruction located in the memory cell at address XY if the bit pattern in register R is equal to the bit pattern in register number 0 . Otherwise, continue with the normal sequence of execution. |
| C | 000 | HALT execution |
