Strategic plan

May 24,2020

Nursing practice interventions is a plan by the nurses to help the patients reach theory goal and health needs. Nursing interventions are the actual treatment that enables the patients to get better and achieves the health goals set (Nilsen et al. 2020). There are three types of nursing interventions that are independent, dependent, and interdependent. This paper will discuss the strategic plans to incorporate nursing practices interventions in the capstone

Before nursing practices are implemented, the organization should consider and analyses the effectiveness and impact of the response. We carry out a quality improvement process to identify a gap that needs an intervention and priorities then identified needs (Mathieson et al., 2019). The goals and objectives of the change are defined and clarified. We will develop new simples and clear guidelines for the new nursing practice to implement.

Active and frequent communication should be done during the implementation period. The organization's culture should change to facilitate and accommodate the change. Adequate training will be offered to the employees to reinforce positivity and feedback and get them ready to adapt to the change (Nilsen et al. 2020). We will measure the progress of the change and its impacts on progress in implementation and take necessary actions until fully implemented (Mathieson et al., 2019). The source competency and course objectives were identified through the quality check process where a gap was identified, and intervention needed determined.

Conclusion

To sum up, implementation of nursing practice involves the identification of a need, prioritization, effective communication, training, and even progress check. The impacts of the change are also determined.
