

2-1 Discussion: Choosing the Right Data

In your Milestone One assignment, due next week, you will be isolating certain parts of the data set to analyze so that you can reveal the inefficiencies in operational processes. An important first step is to decide what part of the data set you need to isolate. This module's discussion involves deciding on the kinds of data needed to make business decisions involving a specific business process.

For your initial post, consider the scenario presented in the final project. Choose one part of the process (production, sales, or transportation), and discuss what data you would need to analyze to inform business decisions and why.

In response to your peers, choose those who analyzed a different part of the process. Do you agree with your peers' assessments? Is there other data that could be used?

Note: You will not be able to see your peers' posts until you make your initial post.

To complete this assignment, review the [Discussion Rubric](#) document.
